SFWR ENG 3DX4 Summary

Instructor: Dr. Lawford Course: SFWR ENG 3DX4

Math objects made using MathType; graphs made using Winplot.

Table of Contents

Introduction to Systems	1
Laplace	1
Transfer Functions	2
Electrical	2
Cramer's Rule	3
OP-Amps	3
Mechanical	
Translational Systems	3
Rotational Systems	

Note: the following summaries may be useful:

- SFWR ENG 2MX3
- ENGINEER 3N03
- TRON 3TA4

I may review to clarify or correct, but mostly I will omit those things.

Introduction to Systems

Systems can be represented by **block diagrams** to make it easier to marginalize the different parts of the systems.

Laplace

Useful for...

Time begins when your signal begins

$$h(t) = \begin{cases} 0, & t < 0 \\ 1, & t \ge 0 \end{cases}$$

Initial conditions:

• c(0)

Time domain (t): variables are <u>lower case</u>, e.g. f(t)

Frequency domain (s): variables are upper case, e.g. F(s)

Transfer function:

When doing the inverse Laplace, it's useful to break your fractions up so that you can

Strictly Stable: it will eventually get back to the initial position

Marginally Stable:

Unstable: it will progressively get worse

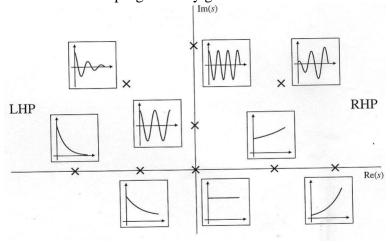

Figure 2.5 from Dorf and Bishop, Modern Control Systems (10th Edition), Prentice-Hall, 2004.

Transfer Functions

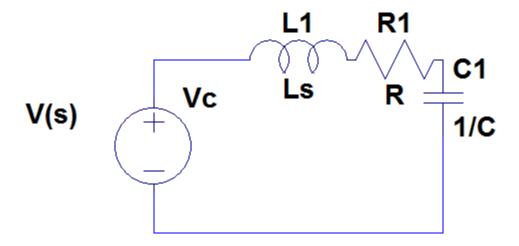

Electrical

admittance:

$$Y(s) = \frac{I(s)}{V(s)} = \frac{1}{R} = G$$

$$V_c(s) = I(s) \frac{1}{Cs}$$

$$I(s) = \frac{V(s)}{L_s + R + \frac{1}{Cs}}$$

Cramer's Rule

$$x_1 = \frac{\det(A_1)}{\det(A)}, x_2 = \frac{\det(A_2)}{\det(A)}, \dots, x_n = \frac{\det(A_n)}{\det(A)}$$

$$V_{C}(s) = H(s) \frac{1}{Cs}$$

OP-Amps

Mechanical

Translational systems:

Rotational Systems:

Newton's Second Law of Motion: $\Sigma f = Ma$

$$Z_{m}(s) = \frac{F(s)}{X(x)}$$
$$f(t) = Ma(t)$$
$$= M \frac{d^{2}x}{dt^{2}}$$

Translational Systems

Spring

Spring is like a capacitor

Force displacement: f(t) = Kx(t)

Viscous Damper

Using viscous fluid to slow something down

Viscous Damper is like a resistor

Force displacement:
$$f(t) = f_v \frac{dx(t)}{dt}$$

Mass

Mass is like a inductor

Force displacement:
$$f(t) = M \frac{d^2x(t)}{dt^2}$$

Rotational Systems
